## **Growth of peritoneal dialysis post Covid-19**

**Edwina Brown**

*Hammersmith Hospital, United Kingdom*

The Covid-19 pandemic provides an opportunity to reset the advantages of dialysis at home. Rates of Covid infection and death are significantly higher for patients on in-centre haemodialysis than for patients dialysing at home. This lecture explores the strategies needed to increase PD utilization post-Covid:

Patient education

PD education for kidney care team

Access to non-surgical percutaneous PD catheter insertion

Pathways for urgent PD start

Access to assisted PD

Increased use of Telemedicine

Reevaluation of existing PD quality metrics
